

WHEN ORDERING A TANKS WEST MIXING TANK

Our aim at Tanks West is the selection of the most cost effective long-term solution to your mixing requirements. It is important we are given complete information on your application. This allows us to provide you with the best and most economic tank and mixer for your purpose.

Important Please Note:

Pricing is not able to be confirmed until the information below is received. The following are some guidelines to assist in establishing the correct information. Clients need to clearly state; **What is the application and the conditions under which the mixer tank will be operated.**

Our technical staff can assist with this information.

1. The batch volume required (how many litres) _____
2. The materials being mixed (what chemicals are involved) _____

3. The viscosity of the liquid (is it thicker than water?) Yes No
4. The specific gravity of the mix (SG) _____
5. Power supply Single 3-phase
6. Loading method (how are the ingredients put into the tank) _____

7. Fitting size and placement (threads, camlocks, etc)

8. Draw down method (does the mixer have to run at varying liquid level*)

*This last point is very important when mixers are being used with materials that are not fully dissolved and require constant agitation.

A standard single impeller mixer cannot be run out of liquid, it must be submerged at all times. If agitation is required as the tank is being emptied then a special low-level mixer must be used.
